7. Next Steps

# Overview & Business Problem

A family is looking for a house in King County, Washington.

They want a house that's good value while also maximizing the quality of the schools in the area.

Determine **which zip code** our family should purchase a house in.

# The Data

1. House sale data from the **King County House Sales dataset**
2. Student test score data from **Washington State's open data portal**
3. School address information from **Washington School Directory**

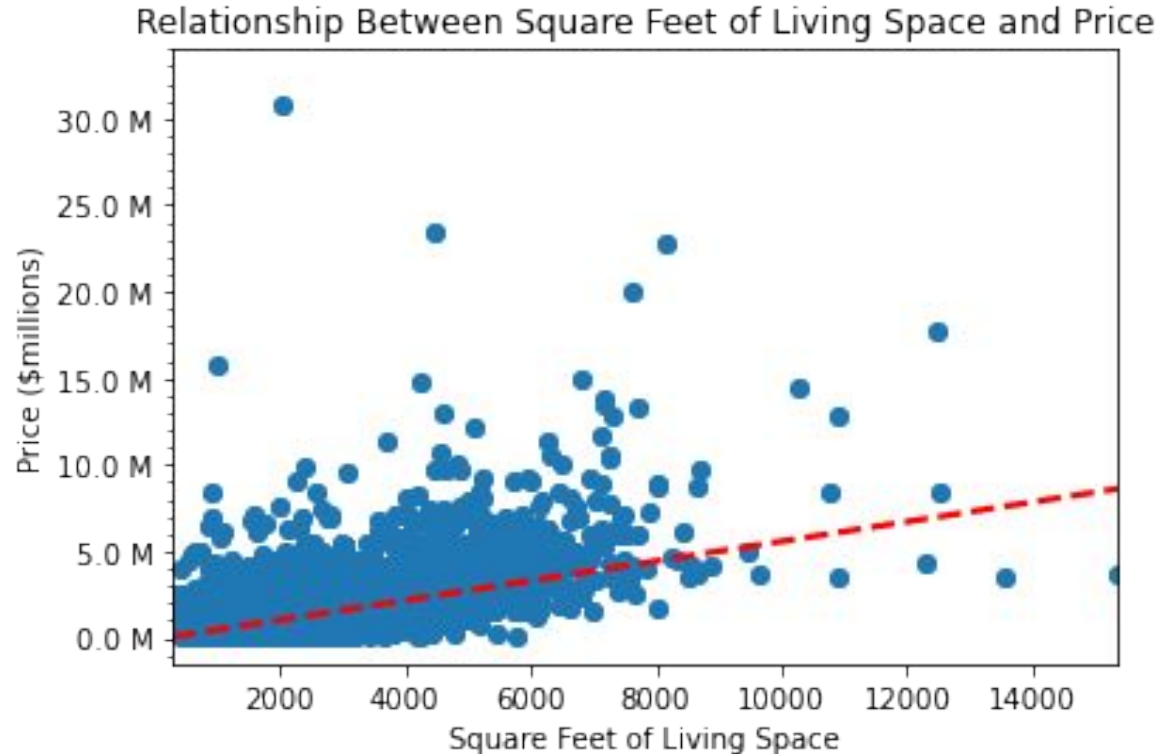

# What Drives Sale Price?

- **Square feet of living space** and **latitude** are closely related to sale price
- **Relationship exists** between variables like square feet of living space and bedrooms and bathrooms

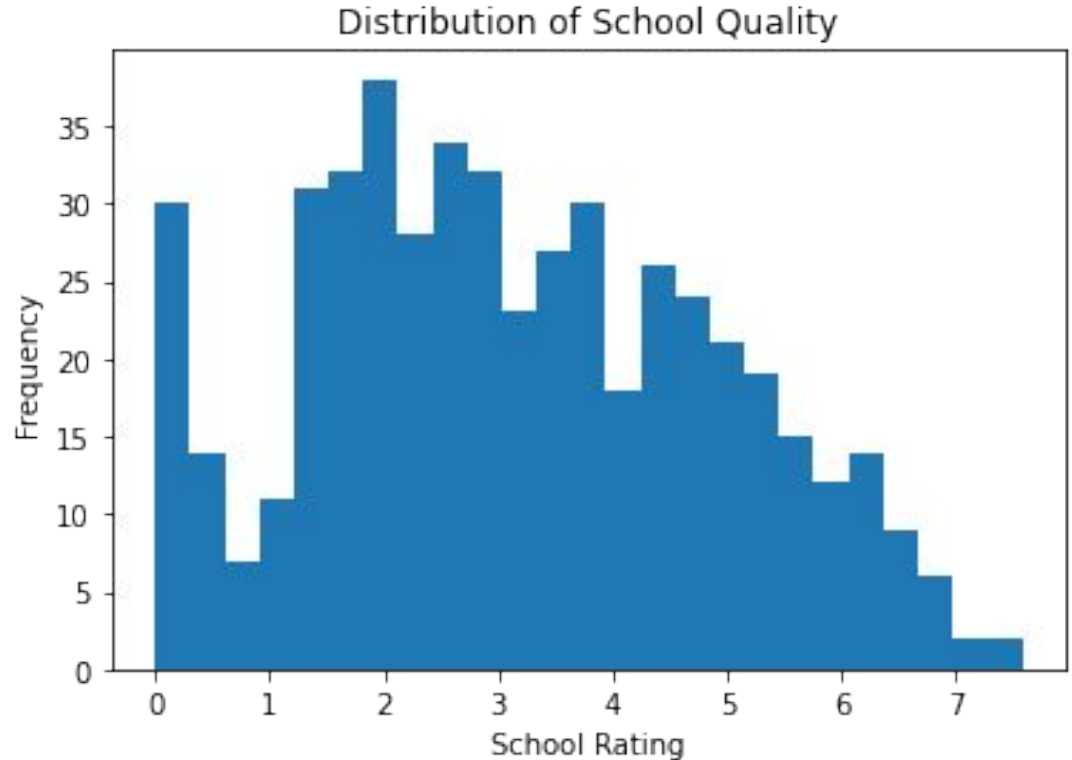

# SQFT Living vs. Sale Price

- Strong **positive relationship**
- Clustering around 2000 sq. ft.

# School Quality

- Test scores as proxy to determine quality rating
- Most schools around 2-3 in rating
- Nothing is higher than 8 out of 10

# School Quality vs. Sale Price

- Strong **positive relationship** between average school quality and average home price by zip code

# The Method

- **Regression modeling** to figure out which elements drive house sale prices in King County.
- Focused on houses with **2-5 bedrooms** and sold between **\$650k-1.3 million**.
- **Maximized school quality** and looked at **houses sold near or under predicted value**.

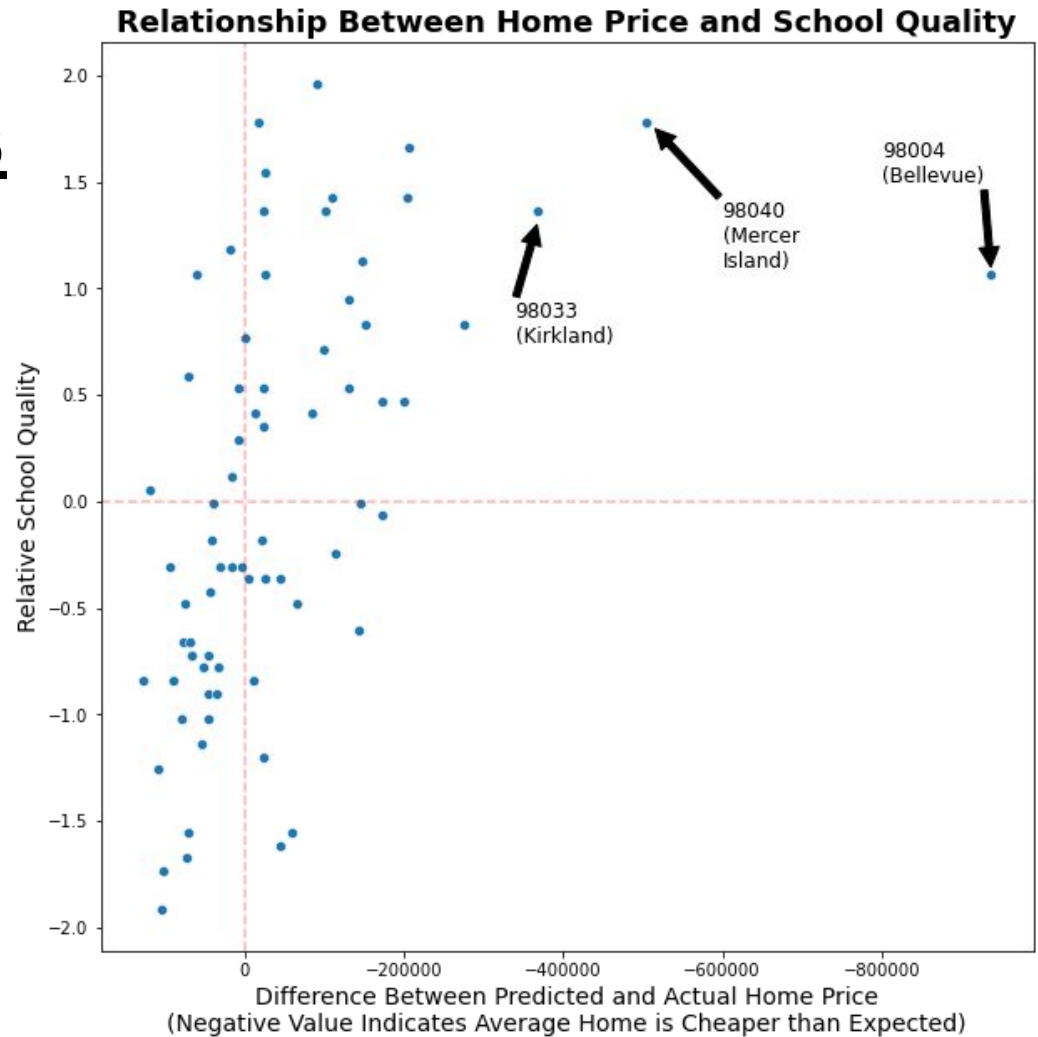

# The Model

- Incorporates key features such as number of bedrooms and bathrooms
- Where necessary, adjusts for characteristics of local market to minimize impact of outliers
- Location, location, location! Made ZIP codes a key feature

# Quadrant Analysis

Our goal is to minimize inflated value of the house and maximize school quality.

The quadrant we want to look at is the **top right** – houses that sold for close to or under our predicted value and schools with the highest test scores.

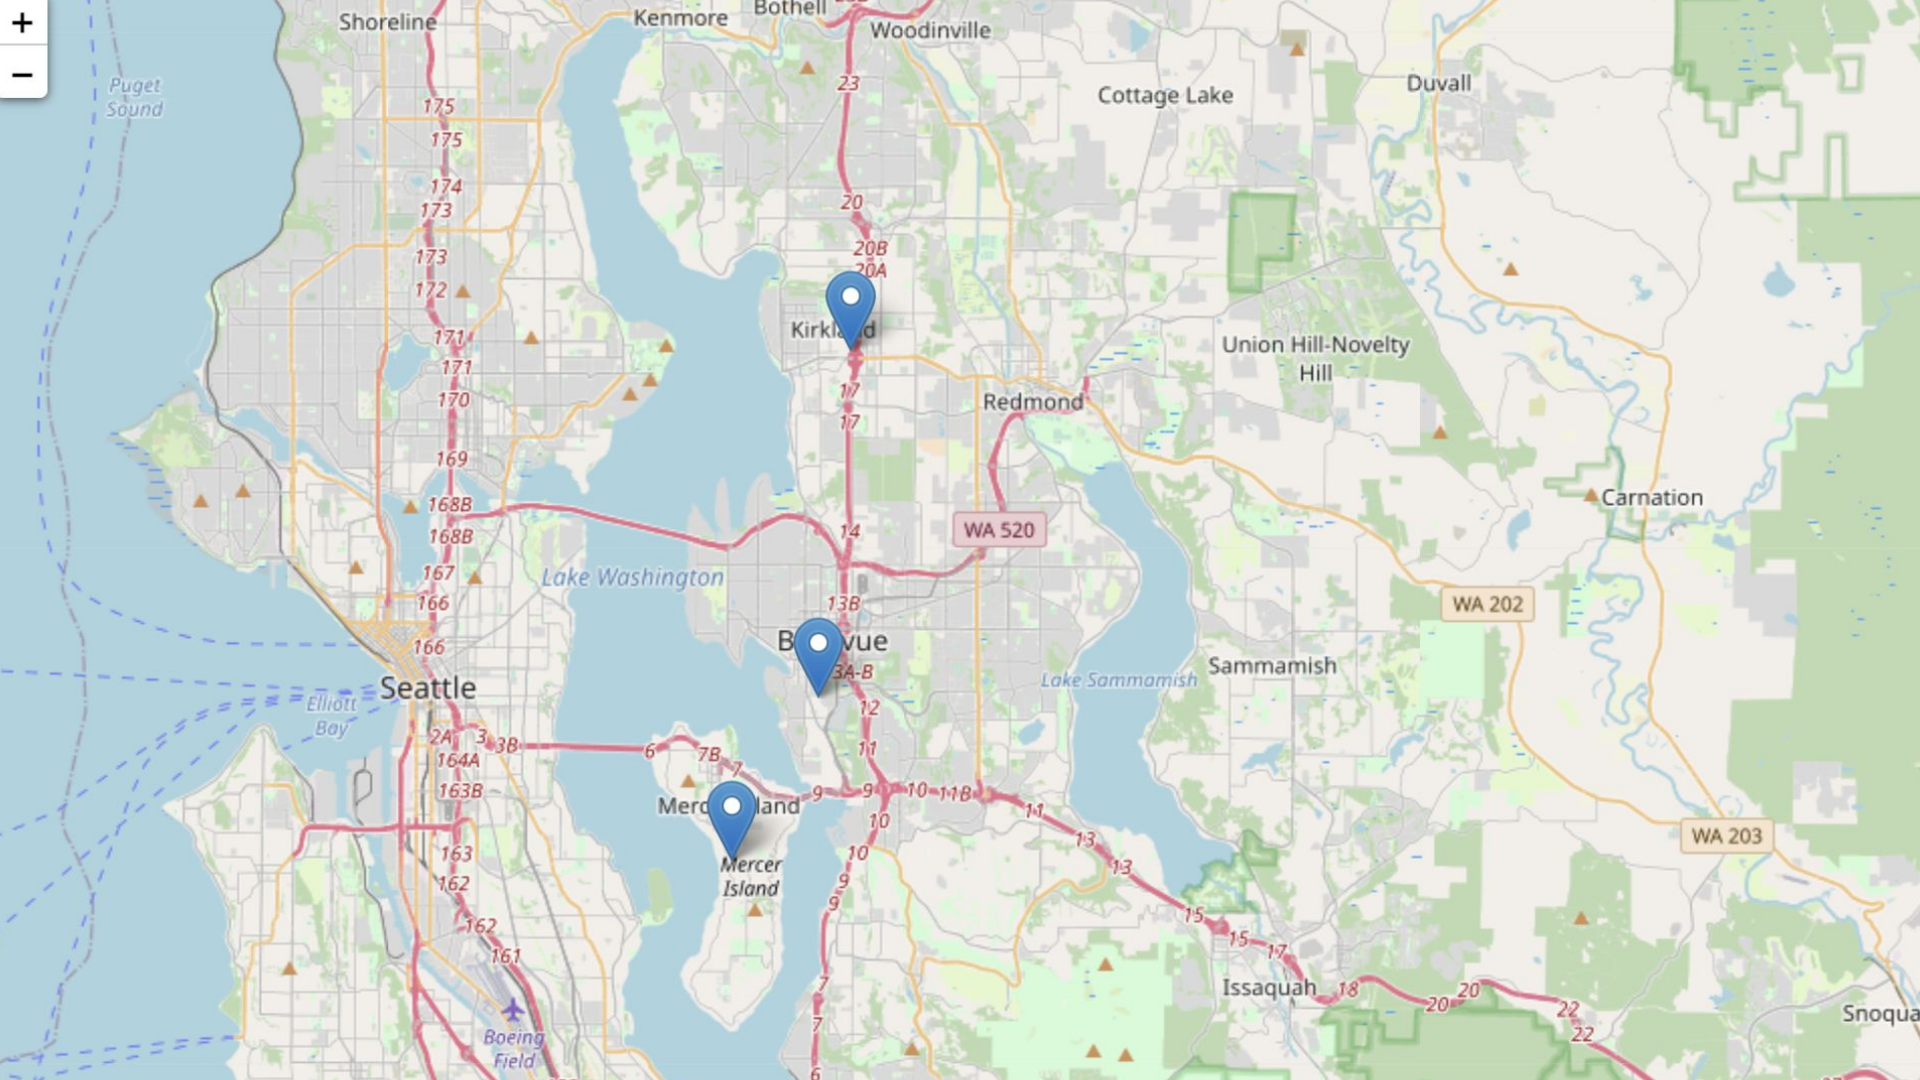

# Recommendations

The winning zip codes are...

**98004**

**98040**

**98033**

## Next Steps

1. **Look at trends in house sales.**
2. **Dig deeper into school quality.**
